- ▶ **General aim:** to revisit Marx's theories of crisis in the light of recent developments in non-neoclassical modelling.

- ▶ **General aim:** to revisit Marx's theories of crisis in the light of recent developments in non-neoclassical modelling.
- ▶ **Specific research question:** **does the original TRPF story hold?** What is the significance of the Okishio's theorem?

- ▶ **General aim:** to revisit Marx's theories of crisis in the light of recent developments in non-neoclassical modelling.
- ▶ **Specific research question:** **does the original TRPF story hold?** What is the significance of the Okishio's theorem?
- ▶ **Method:** quantitative, comparative dynamics exercises. Reaction to changes (shocks) in key exogenous variables.

- ▶ **General aim:** to revisit Marx's theories of crisis in the light of recent developments in non-neoclassical modelling.
- ▶ **Specific research question:** **does the original TRPF story hold?** What is the significance of the Okishio's theorem?
- ▶ **Method:** quantitative, comparative dynamics exercises. Reaction to changes (shocks) in key exogenous variables.
- ▶ **Foundations:** Marx's accounting and complexity approach shows clear resemblance to recent techniques in non-neoclassical macro (notably, SFC and AB).

- ▶ Economy as a **circular flow** of payments and revenues pioneered by François Quesnay. Tableau Économique (1758): physiology of a stylised agricultural economy = blood flow in the human body.

- ▶ Economy as a **circular flow** of payments and revenues pioneered by François Quesnay. Tableau Économique (1758): physiology of a stylised agricultural economy = blood flow in the human body.
- ▶ One century later, Marx recovers and develops Quesnay's insights in the RS, defining the preconditions allowing a capitalist economy to **reproduce** over time.

- ▶ Economy as a **circular flow** of payments and revenues pioneered by François Quesnay. Tableau Économique (1758): physiology of a stylised agricultural economy = blood flow in the human body.
- ▶ One century later, Marx recovers and develops Quesnay's insights in the RS, defining the preconditions allowing a capitalist economy to **reproduce** over time.
- ▶ Marx defines equilibrium conditions in terms of **interdependences** between industries: flows of goods which must be supplied by each industry to meet exactly other industries' demand for inputs.

- ▶ Economy as a **circular flow** of payments and revenues pioneered by François Quesnay. Tableau Économique (1758): physiology of a stylised agricultural economy = blood flow in the human body.
- ▶ One century later, Marx recovers and develops Quesnay's insights in the RS, defining the preconditions allowing a capitalist economy to **reproduce** over time.
- ▶ Marx defines equilibrium conditions in terms of **interdependences** between industries: flows of goods which must be supplied by each industry to meet exactly other industries' demand for inputs.
- ▶ RS do not aim to prove that capitalist economies meet equilibrium conditions. On the contrary, **disequilibrium** or sub-optimal equilibria are the normal state.

- ▶ While Marx never provided a complete mathematical model of enlarged reproduction, he left several notes and **numerical examples** (system of difference/differential equations).

- ▶ While Marx never provided a complete mathematical model of enlarged reproduction, he left several notes and **numerical examples** (system of difference/differential equations).
- ▶ Well-established tradition of dynamic modelling carried out by Marxist economists since the 1970s, who have been inspired by the Marxian reproduction schemes: **Harris 1972, Bronfenbrenner 1973, Morishima 1973**, etc.

- ▶ While Marx never provided a complete mathematical model of enlarged reproduction, he left several notes and **numerical examples** (system of difference/differential equations).
- ▶ Well-established tradition of dynamic modelling carried out by Marxist economists since the 1970s, who have been inspired by the Marxian reproduction schemes: **Harris 1972, Bronfenbrenner 1973, Morishima 1973**, etc.
- ▶ Not many recent contributions though...

- ▶ While Marx never provided a complete mathematical model of enlarged reproduction, he left several notes and **numerical examples** (system of difference/differential equations).
- ▶ Well-established tradition of dynamic modelling carried out by Marxist economists since the 1970s, who have been inspired by the Marxian reproduction schemes: **Harris 1972, Bronfenbrenner 1973, Morishima 1973**, etc.
- ▶ Not many recent contributions though...
- ▶ A few exceptions: **Olsen 2015, Cockshott 2016, MVP 2019**.

The investment in **variable capital** is:

$$V_j - V_{j,-1} = \frac{S_{j,-1} \cdot \theta_j}{1 + q_j} \quad (1)$$

where $j = C, I$ identifies the sector.

The value of **constant capital** is:

$$C_j = V_j \cdot q_j \quad (2)$$

where q_j is the OCC.

The mass of **surplus-value** created in the production is:

$$S_j = \epsilon_j \cdot V_{j,-1} \quad (3)$$

where ϵ_j is the **exploitation rate**.

The (non-contestable) **sectoral profit rate** is:

$$r_j = \frac{S_j}{C_j + V_j} \quad (4)$$

The **rate of growth** (accumulation) is:

$$g_j = \frac{\frac{\theta_j \cdot S_j}{1+q_j}}{V_j} = \epsilon_j \cdot \theta_j \cdot \frac{1}{1+q_j} \quad (5)$$

The **accumulation of constant capital** in C-sector is:

$$S_C \cdot \theta_C \cdot \frac{q_C}{1 + q_C} + C_C = Y_I - C_I - S_I \cdot \theta_I \cdot \frac{q_I}{1 + q_I} \quad (6)$$

where Y_I is the I-sector output value (assumption: realised value = value created *in potentia* in the production).

The **accumulation of variable capital** in C-sector is:

$$\begin{aligned} S_C \cdot \theta_C \cdot \frac{1}{1 + q_C} + C_C &= \\ &= \left(Y_I - C_I - S_I \cdot \theta_I \cdot \frac{q_I}{1 + q_I} - C_C \right) \cdot \frac{1}{q_C} \end{aligned} \quad (7)$$

ENLARGED REPRODUCTION (CONT'D)

The **equilibrium rate of growth** (accumulation) of C-sector's capitalists is:

$$g_C = \frac{S_C \cdot \theta_C \cdot \frac{q_C}{1+q_C}}{C_C} = \frac{Y_I - C_I - S_I \cdot \theta_I \cdot \frac{q_I}{1+q_I}}{C_C} - 1 \quad (8)$$

This condition assures **consistency** of C-sector capitalists' investment plans with I-sector capitalists' production & accumulation plans.

So it guarantees **gravitation** of the economy towards the (enlarged) reproduction equilibrium.

But such a state is extremely **unlikely** to be matched and maintained in practice. RS allow Marx to argue that real-world capitalist economies are always in disequilibrium (or sub-optimal equilibria).

The economy-wide **balanced growth rate** is:

$$g = g_C = g_I = \epsilon_I \cdot \theta_I \cdot \frac{1}{1 + q_I} = \theta_I \cdot r_I \quad (9)$$

Using $g_C = \epsilon_C \cdot \theta_C / (1 + q_I)$, one obtains the (reproduction) **equilibrium condition**:

$$\frac{\theta_C}{\theta_I} = \frac{\epsilon_I}{\epsilon_C} \cdot \frac{1 + q_C}{1 + q_I} \quad (10)$$

The sectoral retention rate ratio must be a direct function of sectoral OCCs, given turnover and exploitation rates.

Since these variables are **independent** of each other, nothing ensures that condition (10) is met.

SOME FAMILIAR FINDINGS

REPRODUCTION,
INNOVATION AND
THE PROFIT RATE

MARCO
VERONESE
PASSARELLA

- ▶ In principle, balanced growth is **possible**, as the expansion of production in one sector enlarges the market for the other.

FINDINGS

THE AMENDED
MODEL

EXPERIMENTS

FINAL REMARKS

SOME FAMILIAR FINDINGS

- ▶ In principle, balanced growth is **possible**, as the expansion of production in one sector enlarges the market for the other.
- ▶ However, 'The rate of growth of production in the various branches of production is determined [also] by the **uneven development** of the conditions of production, rather than by the different rates of growth of the markets for their products'. (Clarke 1990)

SOME FAMILIAR FINDINGS

- ▶ In principle, balanced growth is **possible**, as the expansion of production in one sector enlarges the market for the other.
- ▶ However, 'The rate of growth of production in the various branches of production is determined [also] by the **uneven development** of the conditions of production, rather than by the different rates of growth of the markets for their products'. (Clarke 1990)
- ▶ This leads to a **disproportional development** of the two sectors, which is the form taken by the inner tendency of capitalism to over-accumulation and crisis.

SOME FAMILIAR FINDINGS

- ▶ In principle, balanced growth is **possible**, as the expansion of production in one sector enlarges the market for the other.
- ▶ However, 'The rate of growth of production in the various branches of production is determined [also] by the **uneven development** of the conditions of production, rather than by the different rates of growth of the markets for their products'. (Clarke 1990)
- ▶ This leads to a **disproportional development** of the two sectors, which is the form taken by the inner tendency of capitalism to over-accumulation and crisis.
- ▶ ER conditions are matched if sectors grow all at the same pace. This bears resemblance to the **Cambridge distributive equation** $r = g/\theta$, interpreted as a dynamic investment function in a 2-sector economy.

SOME FAMILIAR FINDINGS (CONT'D)

While I-sector retention rate is an exogenous, the C-sector retention rate(s) must behave like a **buffer** to ensure the equilibrium:

$$\theta_{iC} = \frac{g_{iC} \cdot (1 + q_{iC})}{\epsilon_{iC}} \quad (11)$$

Historically, this 'stabilising' role can be identified with **State** ('Big Government' and 'Big Bank') and the **foreign sector** (imperialism).

SOME FAMILIAR FINDINGS (CONT'D)

Fig. 1 - Impact of a fall in the retention rate of I-capitalists on growth rates

FINAL REMARKS

Innovation spread is defined as the percentage of I-capitalists who get aware of and use the new technique of production:

$$\rho = \rho_0 + ERF\left(\frac{t - t_0}{\rho_1}\right) \quad (12)$$

where $0 < \rho_0 < 1$, $\rho_1 > 0$, $ERF(\cdot)$ is the error function and t_0 is the shock period.

- Two scenarios for real wages and exploitation rates:
 - A) **Higher RWs** for employees, unchanged RW for the class / unchanged exploitation / constant wage share
 - B) **Unchanged RWs** for employees, lower RW for the class / higher exploitation / lower wage share

INCREASE IN INNOVATORS' OCC (CONT'D)

In formal terms, innovators' **constant capital** is:

$$C_{ij}^* = C_{ij} \quad (13)$$

Innovators' **variable capital** is:

$$V_{ij}^* = \frac{C_{ij}^*}{q_{ij}^*} \quad (14)$$

where $q_{ij}^* > q_{ij}$, and **surplus value** 'created' by innovators is:

$$S_{ij}^* = \epsilon_{ij} \cdot V_{ij}^* \quad (15)$$

Note: X_{ij} keeps growing at the same pace. Innovation entails a **higher labour productivity**: $a_{ij}^* > a_{ij}$, where $a_{ij} = X_{ij}^*/L_{ij}^*$ and $L_{ij} = (V_{ij} + S_{ij})/m_0$.

INCREASE IN INNOVATORS' OCC (CONT'D)

Model's findings using **class-based** definition of subsistence:

- ▶ Individual incentive to innovate (mechanisation)
- ▶ Innovation assures a higher individual profit rate in the short run (due to lower wage costs)
- ▶ The increase in innovators' profit is only temporary
- ▶ Innovators' profit rate declines as innovation spreads
- ▶ *Given the exploitation rate*, the general rate of profit declines, due to higher OCC

INCREASE IN INNOVATORS' OCC (CONT'D)

Model's findings using **class-based** definition of subsistence:

- ▶ Individual incentive to innovate (mechanisation)
- ▶ Innovation assures a higher individual profit rate in the short run (due to lower wage costs)
- ▶ The increase in innovators' profit is only temporary
- ▶ Innovators' profit rate declines as innovation spreads
- ▶ *Given the exploitation rate*, the general rate of profit declines, due to higher OCC
- ▶ Employed workers enjoy a higher real wage (due to higher productivity and lower prices)

INCREASE IN INNOVATORS' OCC (CONT'D)

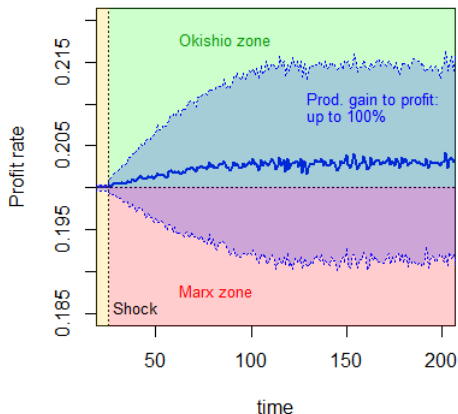

Model's findings using **class-based** definition of subsistence:

- ▶ Individual incentive to innovate (mechanisation)
- ▶ Innovation assures a higher individual profit rate in the short run (due to lower wage costs)
- ▶ The increase in innovators' profit is only temporary
- ▶ Innovators' profit rate declines as innovation spreads
- ▶ *Given the exploitation rate*, the general rate of profit declines, due to higher OCC
- ▶ Employed workers enjoy a higher real wage (due to higher productivity and lower prices)
- ▶ But no improvement for working class as a whole!

B. What if **individual-based** definition of subsistence?
(capitalists can get up to 100% of productivity earnings, so
declining wage share)

FINAL REMARKS

Findings using **individual-based** definition of subsistence:

- ▶ The actual exploitation rate increases, thereby supporting profitability
- ▶ Two sub-scenarios for r :
 - If capitalists get a large share of productivity gains, tendency to increase (rather than fall)
 - If capitalists get a small share of productivity gains, the profit rate increases for innovators but not for the rest
- ▶ Routine capitalists and latecomers are affected anyway
- ▶ Corollary 1: **market contestability** (C-sector) as additional counteracting factor

Findings using **individual-based** definition of subsistence:

- ▶ The actual exploitation rate increases, thereby supporting profitability
- ▶ Two sub-scenarios for r :
 - If capitalists get a large share of productivity gains, tendency to increase (rather than fall)
 - If capitalists get a small share of productivity gains, the profit rate increases for innovators but not for the rest
- ▶ Routine capitalists and latecomers are affected anyway
- ▶ Corollary 1: **market contestability** (C-sector) as additional counteracting factor
- ▶ Corollary 2: if subsistence = primary needs, **working-class reproduction conditions are endangered...**

Okishio (1961): if w/p is constant then r must rise following the introduction of a *viable* technique of production (that cuts production costs) – subscenario (B)

Okishio (1961): if w/p is constant then r must rise following the introduction of a *viable* technique of production (that cuts production costs) – subscenario (B)

Foley(1986): if the *value of labour-power* remains constant then r falls with the new technique.

Alternative formulation: if capitalists do not benefit (much) from productivity gains then the wage share remains (approximately) constant – subscenario (A)

Okishio (1961): if w/p is constant then r must rise following the introduction of a *viable* technique of production (that cuts production costs) – subscenario (B)

Foley(1986): if the *value of labour-power* remains constant then r falls with the new technique.

Alternative formulation: if capitalists do not benefit (much) from productivity gains then the wage share remains (approximately) constant – subscenario (A)

Real wage rates have been growing, while the value of labour power has been falling in the last decades. So no *a priori* conclusion is possible.

Okishio (1961): if w/p is constant then r must rise following the introduction of a *viable* technique of production (that cuts production costs) – subscenario (B)

Foley(1986): if the *value of labour-power* remains constant then r falls with the new technique.

Alternative formulation: if capitalists do not benefit (much) from productivity gains then the wage share remains (approximately) constant – subscenario (A)

Real wage rates have been growing, while the value of labour power has been falling in the last decades. So no *a priori* conclusion is possible.

However, incentive to introduce labour-saving innovation is not necessarily at odds with TPRF!
Okishio's findings are not generalisable.

FINAL REMARKS

► Model's cons:

- Low interaction (vertical class conflict)
- No financial assets (endogenous money, but implicit)

► Model's cons:

- Low interaction (vertical class conflict)
- No financial assets (endogenous money, but implicit)
- Prices & competition just sketched, normal utilisation

- ▶ Model's cons:
 - Low interaction (vertical class conflict)
 - No financial assets (endogenous money, but implicit)
 - Prices & competition just sketched, normal utilisation
- ▶ Model's pros:

- ▶ Model's cons:
 - Low interaction (vertical class conflict)
 - No financial assets (endogenous money, but implicit)
 - Prices & competition just sketched, normal utilisation
- ▶ Model's pros:
 - Sheds light on tendency (then move to counteracting factors)

► Model's cons:

- Low interaction (vertical class conflict)
- No financial assets (endogenous money, but implicit)
- Prices & competition just sketched, normal utilisation

► Model's pros:

- Sheds light on tendency (then move to counteracting factors)
- Bridges gap between 'old' CPE and recent developments

► Model's cons:

- Low interaction (vertical class conflict)
- No financial assets (endogenous money, but implicit)
- Prices & competition just sketched, normal utilisation

► Model's pros:

- Sheds light on tendency (then move to counteracting factors)
- Bridges gap between 'old' CPE and recent developments
- Two contributions:

▶ Model's cons:

- Low interaction (vertical class conflict)
- No financial assets (endogenous money, but implicit)
- Prices & competition just sketched, normal utilisation

▶ Model's pros:

- Sheds light on tendency (then move to counteracting factors)
- Bridges gap between 'old' CPE and recent developments
- Two contributions:
 - ▶ **non-contestability** as additional counteracting factor

▶ Model's cons:

- Low interaction (vertical class conflict)
- No financial assets (endogenous money, but implicit)
- Prices & competition just sketched, normal utilisation

▶ Model's pros:

- Sheds light on tendency (then move to counteracting factors)
- Bridges gap between 'old' CPE and recent developments
- Two contributions:
 - ▶ **non-contestability** as additional counteracting factor
 - ▶ Foley-Marx and Okishio as poles of a **spectrum**...

- ▶ Model's cons:
 - Low interaction (vertical class conflict)
 - No financial assets (endogenous money, but implicit)
 - Prices & competition just sketched, normal utilisation
- ▶ Model's pros:
 - Sheds light on tendency (then move to counteracting factors)
 - Bridges gap between 'old' CPE and recent developments
 - Two contributions:
 - ▶ **non-contestability** as additional counteracting factor
 - ▶ Foley-Marx and Okishio as poles of a **spectrum**...
- ▶ Marx's simple OCC story shows that there is no necessary contradiction between individual incentive to innovate and TPRF. On the contrary, TPRF can be an unintended consequence of individual innovations.
